repair thread

PITCH & BUILD STORY

Every repair. The whole story.

Computer vision for equipment records and property maintenance handoffs

48-hour hackathon brief / October 2026

01 / INSPIRATION

A practical use for computer vision

“Which dishwasher is actually in Unit 304B?”

The idea began with hard-to-read serial and model labels. The product became more useful when those details stayed attached to a unit and its repair history.

02 / PROBLEM

The repair starts with missing context

A request identifies the unit

“The dishwasher is broken” still leaves the equipment unclear.

Someone reconstructs the record

Find the label photo, transcribe identifiers and collect the issue details.

The next handoff can lose that work

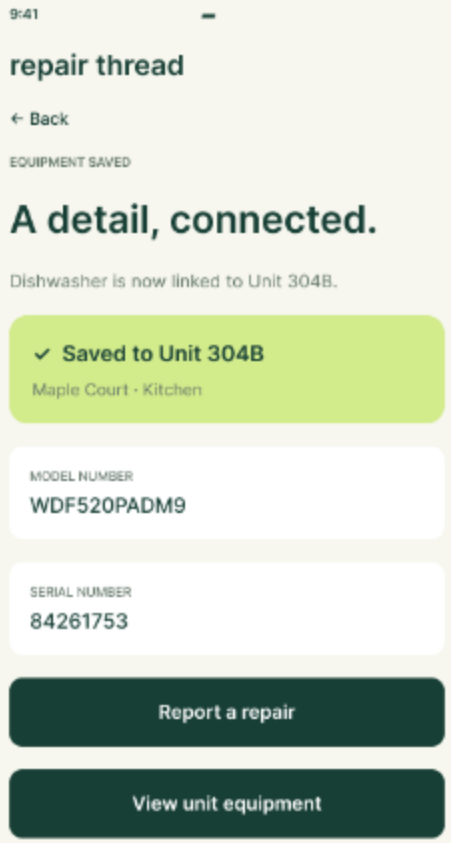

The quote, decision and replacement record may live in separate places.

03 / PRODUCT

A label becomes a unit record

Capture the identifiers.
Review the result.
Save it to the right unit.

Carry that record into the repair request
and preserve it when equipment changes.

04 / COMPUTER VISION

A camera already in your pocket

Capture

Photograph the equipment’s model and serial label.

Extract

Local OCR reads text and suggests identifier fields.

Review

Compare the result with the source before saving.

05 / WORKING PRODUCT

A working path through the core workflow

Web and Windows

Live camera preview, still capture, local OCR and equipment records.

Connected repair records

Requests, proposal versions, recorded decisions and replacement history.

Evidence today

Sample OCR returned the expected model and serial. The user confirmed webcam preview.

Shared accounts, live purchasing and production approval roles are future work.

06 / CUSTOMER

The maintenance coordinator is the champion

200–1,500

managed units per target organization

Buyer

Owner or operations director

First fit: independent residential property managers with recurring equipment repairs and incomplete inventory records.

07 / POSITIONING

A focused layer around the equipment record

Fits alongside existing management software

Begin with unit lists and exports instead of requiring a platform replacement.

Competes on workflow completion

Capture once, preserve the original label and carry context into the repair.

Must prove a reason to switch behavior

Measure fewer missing-detail follow-ups and less coordinator handling time.

08 / BUSINESS MODEL

An organization license with recurring revenue

$149

per month, including 200 units

+$0.50

per additional managed unit / month

500 units: $299/month

1,000 units: $549/month

Proposed pricing for validation. Billing and shared organization access are not live.

09 / ECONOMICS

Recurring revenue needs controlled delivery costs

$299

Example monthly account revenue

$59.80

Maximum direct cost at an 80% gross-margin target

100 accounts at this mix would equal $29,900 MRR.

Illustrative scenario, not traction or a forecast. Excludes sales, development and overhead.

10 / GO TO MARKET

A paid pilot should test the business

Recruit three design partners

Target independent managers through direct outreach and maintenance referrals.

Offer a focused 30-day evaluation

Proposed $149 pilot with guided setup and a small set of eligible repair cases.

Earn the ongoing subscription

Compare handling time, record completeness and repeat usage before renewal.

11 / AI BUILD STORY

AI helped move the idea into working software

Discovery and product definition

Explored serial capture, unit records, positioning and requirements.

Brand and interaction design

Iterated names, visual identity, landing page and mobile walkthrough.

Implementation and validation

Built the web app, camera/OCR flow, installer, tests and deployment changes.

12 / BUILD PROCESS

Human decisions kept the build grounded

AI contribution

Drafted requirements and code
Created editable design assets
Investigated failures
Ran checks and deployed changes

Human contribution

Selected the problem and brand
Challenged weak design
Confirmed webcam preview
Chose the animation fallback

A real constraint: Higgsfield generation was unavailable on the account plan.
We built a custom 10-second web animation instead.

13 / PRODUCT ROADMAP

A digital assistant, grounded in the record

First: prepare a shared workspace

Add authentication, organization permissions, sync, audit trails and billing.

Then: assist the coordinator

Summarize unit history, flag missing identifiers and draft request details.

Keep people in control

Show source records. Require confirmation before messages, approvals or purchases.

14 / NEXT MILESTONE

The next proof comes from real repair cases

3 design partners

One repeatable onboarding process.
A measured comparison of coordinator effort.
Evidence of willingness to keep paying.

Seeking pilot introductions and workflow feedback

A sample label you can scan

Expected result

MODEL
ABC12345

SERIAL
98765432

Show this slide on another screen or print it. Open the live scanner on your phone, allow camera access and capture just the label. You can also upload the label PNG.

Synthetic test data. The landing-page scanner displays identifiers without saving an equipment record.

16 / LIVE WALKTHROUGH

Try the product story

Phone demo

Open repair-thread.vercel.app
and choose “Phone walkthrough”.

Real computer vision

Choose “Try the live scanner”.
Use a label photo or the built-in sample.
